

Position: Senior Java Developer

Job Description:

Senior developer is besides having the responsibility of coding, adhering to standards and executing unit tests, the developer is fully aware of the business context of the module being developed and often needs to discover gaps in the application and make recommendations. The developer needs to perform peer reviews on their code and remain responsible for it until it is successfully rolled out into production.

Responsibilities:

- Work with Project Manager and TTL to create technical proposals for customers
- Develop and implement software tools using java programming technologies to fulfill the specific requirements
- Require involvement in all phases of the system development life-cycle including requirements gathering, writing, technical specifications, application design, production rollout and maintenance
- Coordinate with other team members and deliver high quality production on time
- Encode, test, debug and install the operating programs and procedures in coordination with computer operations and user departments
- Guide and support junior developers

Qualifications:

- BS/MS Degree in Computer Science or related discipline
- At least 5 years of relevant working experience in Java and web application development
- Experience in designing, developing Enterprise Java/XML/Database Applications
- Strong knowledge of Java, Websphere Application, SOA Frame and Relational Database
- Knowledge of OO Methodology, UML, Rational Rose and Design Patterns is essential
- Familiar with NetBean, Eclipse, PrimeFace, JBoss, JasperReport, Flex is a plus
- Technically competent, creative, with initiative and ability to work independently
- Ability to work under a fast paced delivery oriented environment

- Good command of both written and verbal English is a must
